

AI WeatherWise API

Project title: “ AI WeatherWise Api ”

Team Leader: G.Kaviya

Team Members:

- M.Keerthana
- S.Janani
- J.Janapriya
- D.Jenifer

3: Project Design Phase Phase Phase

Introduction:

- The Project Design Phase defines the technical structure and operational behavior of the AI WeatherWise API. It describes how different components of the system communicate with one another, how weather data is collected and processed, and how information is provided to the user.

System Architecture:

The system architecture represents the overall structure of the AI WeatherWise API and shows how the major components communicate with each other.

The proposed system consists of several major components:

- **User/Client:** The user interacts with the system through a web application, mobile application, or API client. The user provides information such as a city name, location, or weather-related request.
- **Weather API/Weather Service:** The backend communicates with an external weather data provider to obtain current or forecast weather information.
- **AI Processing Module:** The AI component can process retrieved weather information and convert technical weather data into understandable summaries or recommendations.
- **Database or Storage:** If required, the system can store selected information such as user preferences, request history, cached weather data, or system logs.

System Architecture

API Design:

- API Design defines how clients communicate with the AI WeatherWise backend. The API follows a structured request-response model and can use standard HTTP methods.

Data Design:

- Data Design defines the type, structure, and organization of information used by the AI WeatherWise API.
- Weather information can originate from an external weather service and then be transformed into the application's required data structure.

Input and Output Design:

- Input and Output Design defines what information enters the system and how the system communicates the processed results back to the user.
