1: Brainstorming & Ideation Phase

Introduction:

The Brainstorming & Ideation Phase is the initial stage of developing AI-WeatherWise, an AI-powered weather information and forecasting system designed to provide users with useful and easily understandable weather information. During this phase, the main problem, user needs, system components, important features, and possible solutions were identified. The ideas were discussed and organized to create a clear understanding of how AI-WeatherWise should work and how its different modules should interact with each other.

Problem Identification:

The project identifies several problems faced by users while accessing and managing weather information. Users may find it difficult to track and manage multiple favorite weather locations. They may also receive only raw weather metrics without simple explanations or personalized suggestions. There is also a need for recommendations related to outdoor activities and clothing based on current weather conditions. In addition, users need a secure system to store and synchronize their preferences.

Project Idea:

The proposed project is **AI WeatherWise**, a RESTful backend platform designed to provide real-time weather information and intelligent weather insights. The system integrates weather data with **Google Gemini AI** to generate natural-language weather summaries and

personalized recommendations based on live environmental conditions. Users can also manage their favorite locations through the system.

Reason for Selecting the Idea:

The idea was selected to make weather information more useful and easier to understand. Instead of requiring users to interpret only raw weather metrics, the system provides AI-generated summaries and recommendations. It also provides a centralized way to manage favorite locations and user preferences.

Possible Solutions:

The following solutions were identified for the project:

- Provide real-time weather information.
- Allow users to add, view, update, and delete favorite locations.
- Generate easy-to-understand weather summaries using Google Gemini AI.
- Provide personalized recommendations based on weather conditions.
- Provide recommendations for outdoor activities and suitable clothing.
- Securely store user information and preferences.
- Use authentication to protect user-specific features.
