

# AI WeatherWise API

**Project title:** “ AI WeatherWise Api ”

**Team Leader:** G.Kaviya

**Team Members:**

- M.Keerthana
- S.Janani
- J.Janapriya
- D.Jenifer

## 6: Project Testing Phase

### API Testing:

The developed REST APIs are tested using Postman or Thunder Client to verify the functionality and responses of the backend APIs.

### Register API Testing:

The Register API is tested to verify that new users can be registered successfully and the required user information is processed correctly.

### Login API Testing:

The Login API is tested to verify user authentication and access to protected API resources.

### Weather API Testing:

The Weather API is tested to verify that the system can retrieve and return current weather information correctly.

### Recommendation API Testing:

The Recommendation API is tested to verify the generation of AI-based weather recommendations using the available weather information.

## **Database Testing:**

The MongoDB connection and Mongoose schemas are tested to ensure that the backend can communicate with the database and process the required user and location data.

## **Execution Testing:**

The backend is executed locally using Node.js after installing dependencies and configuring the required environment variables. Successful execution connects the application to MongoDB and starts the server for API requests.
